

Splitting up the work

Idea- We got together as a group to come up with the idea, with each person contributing to the discussion and the final plan

Design – Once a rough idea of what the project should look like was come up with the actual design was done by Yoojin. This included the mock ups used in the first presentation

Presentation - Was made by Nick. The whole group was prepared to present it together

Base Functionality – The base of the visualization tool, including the pulling the closest friends was done by Caleb.

Backend API to get mood – The code uses a backend script that is passed a friend's id and it returns their mood. This was created almost entirely by Rishi

Finalizing the visualization front end – this was done primarily through collaboration of Caleb, Noah, and Nick. On the design and image end of it finalizing Yoojin did most of it.
